1 INTRODUCTION

The 2014 edition of *European Vehicle Market Statistics* offers a statistical portrait of passenger car, light commercial and—for the first time—also heavy-duty vehicle fleets in the European Union from 2001 to 2013. As in previous editions, the emphasis is on vehicle technologies, fuel consumption, and emissions of greenhouse gases and other air pollutants.

The following pages give a concise overview of data in subsequent chapters and also summarize the latest regulatory developments in the EU. More comprehensive tables are included in the annex, along with information on sources.

Number of vehicles

After declining for several years, new passenger car registrations in the EU remained steady at about 12 million in 2012 and 2013. That number is about 20 % below where it was before the economic crisis, when there were about 15.6 million cars sold annually in the EU. The decline in vehicle sales was most pronounced for the southern EU Member States. In Spain, the number of new car registrations fell by more than 50% between 2007 and today. Yet even in southern Europe vehicle sales seem to have reached their minimum level: in Spain there were slightly more cars sold in 2013 than in the year before.

The European market remains centered on a handful of countries. *Some 75 % of all new passenger car registrations occur in the five largest markets (Germany, France, United Kingdom, Italy, and Spain).* But from the point of view of makes and manufacturers, the market is much more diverse: the top seven brands capture only about 50 % of the market.

This is very different from the heavy-duty vehicle market. Only five manufacturers dominate truck sales. Together they account for nearly all new vehicle registrations. In contrast to other

heavy-duty vehicle markets, the same manufacturer usually makes both the vehicle and its engine in Europe. Therefore, the heavy-duty engine market in Europe is also dominated by the same five manufacturers. The total number of newly registered heavy-duty trucks and buses in the EU in 2013 was 0.3 million. The main markets for trucks are the same as for cars, with the addition of Poland, which accounts for about 6 % of heavy-duty vehicle sales but only 2 % of cars.

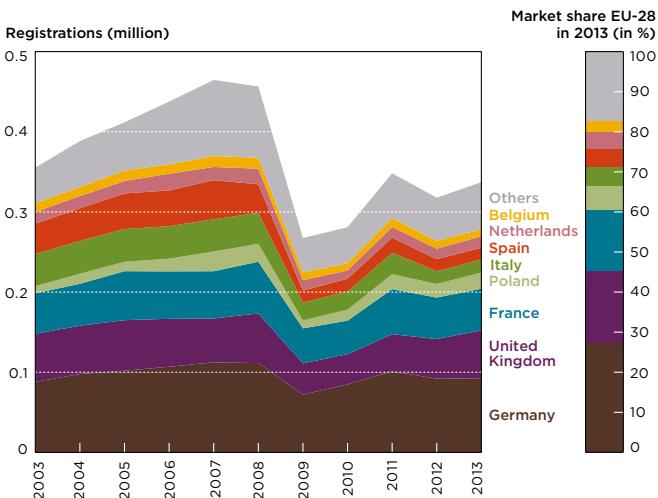

Fig. 1-1

Internationally, total vehicle (passenger plus commercial) sales grew at a somewhat slower pace than in 2012. While China, the US, Mexico, Indonesia, Argentina, and Turkey enjoyed robust growth, sales were flat to negative in the EU, Brazil, India, Russia, South Korea, and Thailand. *Global vehicle sales reached another all-time high at 81 million units.* This is a 33 % growth in vehicle sales in just four years. Most of the growth in vehicle sales took place in the top 15 vehicle markets: of the 3.58 million additional cars and trucks sold globally in 2013 compared with

2012, some 96% (or 3.45 million units), were sold there. Most of the growth in those markets was concentrated in just two countries, China and the US. Together, these two markets account for 47% of the global vehicle sales worldwide. Emerging market economies with very high growth in the past few years—Brazil, India, Russia, and Thailand—all experienced declines in sales in 2013.

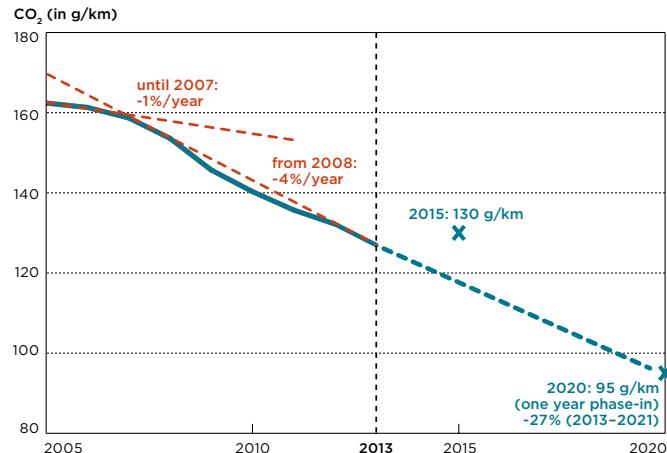

Fuel consumption and CO₂ emissions

2013 was the first year in which average carbon dioxide (CO₂) emissions from new passenger cars fell below the 130 g/km target that applies from 2015 on. According to the European Environment Agency, the exact value was 127.0 g/km (EEA, 2014). Thus, the 2009 EU legislation setting binding CO₂ targets has proven effective. The annual CO₂ reduction rate for new cars on the market has increased from about 1% prior to 2008 to about 4% since then, and the 2015 target has been met already two years in advance. CO₂ emissions and fuel consumption are directly linked, so that the current level of emissions amounts to about 5.2 liters/100km.

Fig. 1-2

CO₂ emissions of new cars in the EU

<http://goo.gl/ND84Oa>

Effects of phase-in, super-credits and eco-innovations not shown here.

In 2012, the European Commission formally proposed an average CO₂ emissions target of 95 g/km for 2020, which translated into fuel consumption equates to about 3.8 liters/100km. Details of the proposal had been under discussion in the European Parliament and the European Council in the first half of 2013, with the European Parliament proposing some changes to the European Commission document, including a 2025 target range of 68–78 g/km of CO₂. The final vote on the issue was scheduled for June 2013, but was delayed at the last minute as a result of direct intervention of German chancellor Angela Merkel. In November 2013, a final compromise was reached, and the regulation was formally adopted in March 2014.

Under the new EU regulation, only 95% of the new vehicle fleet must comply with the 95 g/km target by 2020 (ICCT, 2014a). After one year of phase-in, from 2021 all new vehicles will then be taken into account for calculating the manufacturers' fleet averages. CO₂ emission targets for every manufacturer are adjusted for the average weight of their specific vehicles, so that manufacturers of heavier vehicles get a less stringent target to meet. In percentage terms, the required reduction is the same for every manufacturer: 27 percent from 2015 to 2020/21. So-called 'super-credits' for vehicles with CO₂ emissions lower than 50 g/km are also taken into account. As a result, these vehicles count double in 2020, with the multiplier-factor reduced to 1.0 by 2023 (ICCT, 2014b).

Light-commercial vehicles (i.e., commercial vehicles below 3.5 metric tons gross vehicle weight) have their own CO₂ emission standard. The 2017 target requires an average fleet emission level of 175 g/km—a level that was reached in 2013. A new regulation setting a 2020 target of 147 g/km, was adopted in February 2014. As for passenger cars, vehicle weight is taken into account when calculating manufacturer-specific CO₂ targets.

On heavy-duty vehicles, in May 2014 the European Commission published a strategy for reducing CO₂ emissions. According to this strategy paper, the focus of the EU in the short term will be on certifying, reporting, and monitoring heavy-duty CO₂ emissions. For this purpose, the European Commission has developed VECTO, a computer simulation tool to determine CO₂ emission levels of new heavy-duty vehicles. The Commission expects that this new tool will provide greater transparency and better comparability for CO₂ emission performance and fuel consumption of trucks and buses. The corresponding legislative proposal to introduce VECTO in the EU may be brought forward in 2015. In the medium term, the Commission will also consider further measures, such as setting mandatory CO₂ emission limits for newly-registered heavy-duty vehicles. The EU is the only major truck market in the world without a CO₂ emission regulation (ICCT, 2014c).

Technologies

The vast majority of Europe's new cars remain powered by gasoline or diesel motors. Diesel cars account for 53 % of all new registrations in 2013, slightly less than in 2012. This situation differs notably from other major car markets. The US, Chinese and Japanese markets are all dominated by gasoline-powered cars, with diesels playing almost no role. One market of note that has embraced diesel technology, however, is India, where the diesel share was around 50 % in 2013.

The market share of hybrid-electric vehicles in the EU keeps increasing and reached a level of 1.4 % of all new car sales in 2013. This is still relatively low, but more than twice as high as two years ago. In the Netherlands (5.7%) and France (2.6%) hybrid vehicles make up a much larger share of the market than in the rest of EU Member States. And in the case of Toyota, more than one-fifth of all new vehicles sold by the manufacturer in the EU were hybrid-electric. For comparison, in Japan about 20 %

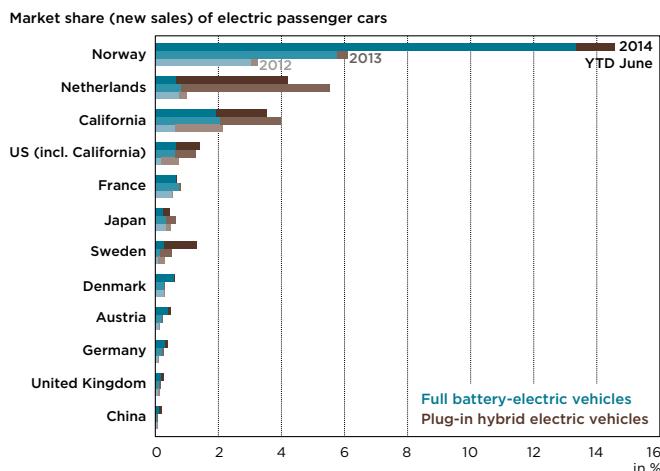

of all new car sales in 2013 were hybrids, and in the US the share of hybrid-electric passenger cars was around 3% (about 6% for passenger cars).

Plug-in hybrid (PHEV) and battery-electric vehicles (BEV) make up about 0.4% of vehicle registrations in the EU, with notable differences among the Member States. In the Netherlands, a stunning 4.1% of all new sales were PHEVs in 2013, and another 1.4% BEVs. The underlying reason is the CO₂-based vehicle taxation scheme in the Netherlands, which features high rebates for vehicles that emit less than 50 g/km of CO₂. Some of these rebates were phased out at the end of 2013, which led to a last-minute run on PHEVs especially. In comparison, for the first half of 2014, the market share of PHEVs and BEVs in the Netherlands decreased to 1.0%. Although they are not members of the EU, we now also include data on Norway and Switzerland in our EU Pocketbook, and particularly for electric vehicles the position of Norway is of great interest. PHEVs and BEVs accounted for 5.8% of all new car sales in Norway in 2013. And in 2014, that market share further increased to 14.6% during the first half of the year (ICCT, 2014d). This makes Norway the world's leading market for electric vehicles (in terms of market share, not absolute number of vehicles). Underlying reasons are, again, fiscal incentives provided by the Norwegian government.

Fig. 1-3

2012-2014 sales
of electric vehicles

<http://goo.gl/4EqAc2>

Key technical parameters

For the first time in years, the average mass of new cars in the EU dropped slightly, to around 1,390 kg in 2013, compared to 1,400 kg in 2012. Ten years earlier, the average weight was around 1,300 kg. As in previous years, both the German and Swedish new car fleets were significantly above the EU average, at 1,469 and 1,573 kg respectively. In contrast, French, Italian and Dutch consumers opted for significantly lighter cars (1,312, 1,307 and 1,291 kg respectively).

Average vehicle engine power and average vehicle size (footprint) remained constant in 2013. Engine displacement and the average number of cylinders of new vehicles were further reduced. Thus, we see a continuation of the trend to squeeze the same amount of power, or more, from smaller engines.

Other emissions and on-road

In September 2014, the Euro 6 emission standard entered into force, although for the time being it only applies to newly type-approved vehicle models. Beginning in September 2015 the standard will become mandatory for all new vehicles in the EU.

In 2013, about 4 % of all new car sales were Euro 6 vehicles, though the variation among manufacturers is wide: from some manufacturers as much as one-quarter of sales are Euro 6-compliant vehicles, while others have as yet no significant Euro 6 fleet.

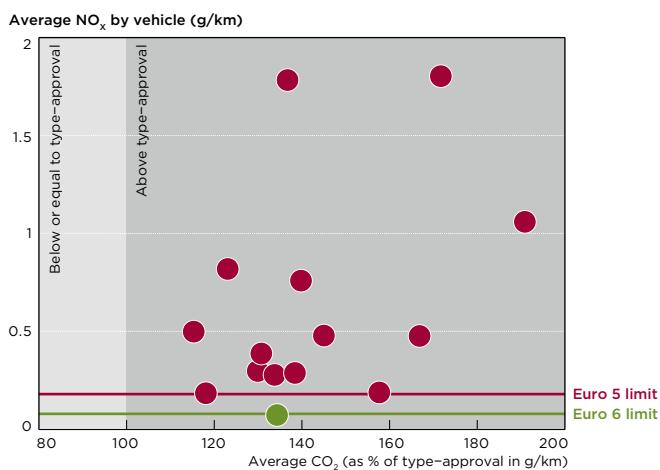

Euro 6 sets emission limits that range from 68% (gasoline carbon monoxide) to 96% (diesel particulates) lower than those established under Euro 1 in 1992. For nitrogen oxide (NO_x) emissions from diesel cars the limits were reduced by 68% from Euro 4 to Euro 6. However, recent analyses indicates that the ‘real-world’ performance—that is, achieved, when driving on-road under normal conditions—is much worse than suggested by the official values (measured in the laboratory using the NEDC driving cycle). An ICCT meta-analysis of on-road driving data for Euro 6-equivalent diesel vehicles concludes that, on average, the vehicles tested show NO_x emission levels that are seven times the Euro 6 limit (ICCT, 2014e). Remarkable differences among the performance of all the vehicles tested were found, with a few vehicles performing substantially better than others. This supports the notion that the technology for clean diesels (i.e., vehicles whose average emission levels lie below Euro 6 emission limits under real-world driving) already exists. Unless these technologies are adopted, the high on-road emissions of NO_x from the new diesel technology classes of passenger cars could have serious adverse health effects in the exposed population, including asthma onset in children, impaired lung function, cardiovascular disease and premature death (HEI, 2010).

The European Commission Driving Emissions (RDE) working group is preparing for the introduction of on-road testing with portable emissions measurement systems (PEMS) as part of the passenger car type-approval process in the EU. According to the timeline of the Commission, by the end of 2014 a regulatory proposal to introduce PEMS testing in addition to the already-required laboratory testing in a fixed driving cycle will be brought forward to the Member States. It is expected that this so-called Euro 6+ regulation could take effect in 2017.

Fig. 1-4

Real-world NO_x and CO₂ emissions from Euro 6 equivalent diesel cars

<http://goo.gl/OKrl0Y>

For fuel consumption and CO₂, a similar problem with the real-world performance of vehicles can be seen. A recent ICCT analysis of driving data from more than half a million vehicles in the EU concludes that there is an increasing discrepancy between official (laboratory) values and actual, on-road fuel consumption. While in 2001 the offset was around 8%, by 2013 it had increased to around 31% of the official values for private cars, and as much as 45% for company cars (ICCT, 2014f). This means that today's private vehicles on average consume about 30% more

fuel than suggested by the manufacturers' sales brochures, which are based on laboratory performance measured using the New European Driving Cycle (NEDC).

The new Worldwide Harmonized Light Vehicles Test Procedure (WLTP), with its more dynamic test cycle and tightened test procedure, is expected to result in somewhat more realistic values. The WLTP was adopted in March 2014, and the European Commission is currently preparing its implementation for the type-approval of new cars in the European Union from 2017 on (ICCT, 2014g). A key aspect of the transition will be an appropriate conversion of existing CO₂ targets and CO₂-based taxation schemes from NEDC into WLTP. For this, the European Commission has established a separate working group. It is expected that by the end of 2014 there could be a legislative proposal for the introduction of WLTP in the EU.

2 NUMBER OF VEHICLES

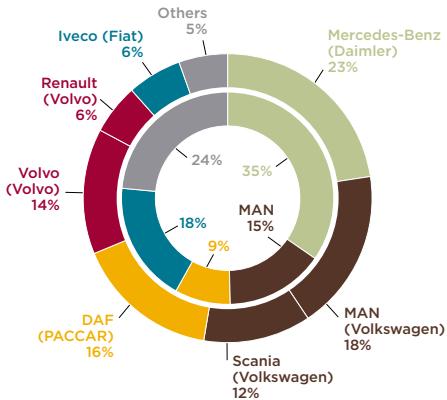

New vehicle registrations:
Trucks and buses over
4.5 metric tons (10,000 lbs)

EU
 Total: 307,000

Vehicle type

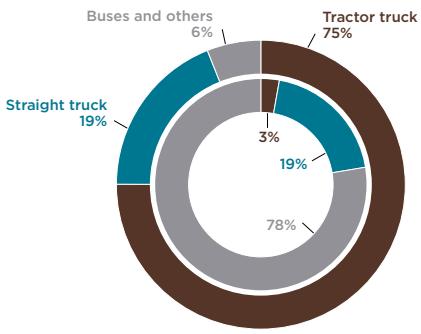

Vehicle manufacturer

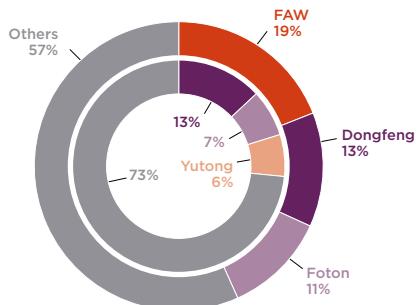

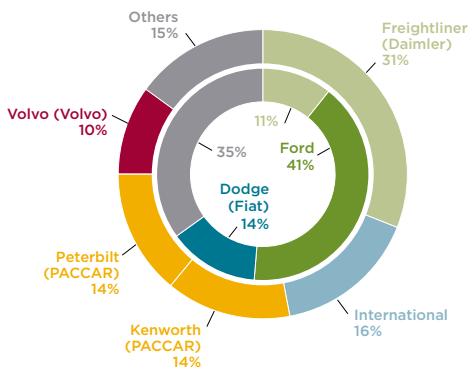

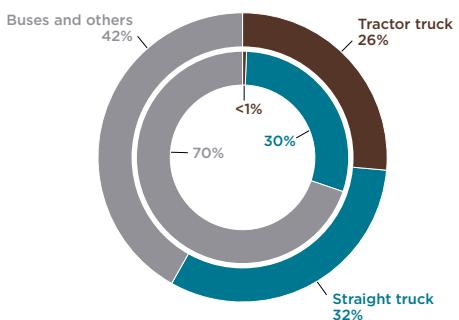

2012 data. US weight classification (class 3 to 8) applied here for all markets,
 i.e. only trucks and buses over 10,000 lbs (about 4.5 tons) are included.
 In the EU and China usually vehicles over 3.5 tons are considered as heavy-duty.
 Data source: ICCT-internal databases

USA
Total: 551,000

China
Total: 1,169,000

The heavy-duty vehicle market in China is growing quickly, with annual registrations that are about twice as high as in the US. Especially in Europe, the market is dominated by only a few vehicle manufacturers and hardly any specialized engine manufacturers. In comparison, the Chinese market is much more fragmented.

New car registrations in the EU were fairly stable at 12 million in 2013, indicating an end to the downward trend that started in 2007, though vehicle registrations remain more than 20% below their peak. Registrations in the EU are dominated by the larger Member States; the three largest alone (Germany, France, United Kingdom) account for nearly 60% of the total (**Fig. 2-1**).

Germany is the largest market, with a 25% market share. Registrations in Germany dropped in 2006–2008, then rose in 2009 thanks to a government scrappage scheme, and from that point on remained stable at around 3 million vehicles per year. In contrast, in Spain, Europe's fifth largest vehicle market, only 0.7 million new cars were registered in 2013, less than half the peak before the economic crisis. For the first time in years, vehicle sales in Spain increased again in 2013 (**Fig. 2-2**).

The European market is very diverse in terms of brand, with the most registered brand, VW, commanding only 13% of the market (**Fig. 2-5**). Most brands are owned by larger companies though, and the top-five companies dominate about 65% of the market.

At 1.4 million, new light commercial vehicle (LCV) registrations account for approximately 10% of the total light-duty vehicle market (**Fig. 2-9**).

The VW Golf remains the most popular car model in Europe. It accounted for about 3.8% of all new vehicle sales in the EU in 2013. On the LCV side, Ford Transit leads, with about 9.8% of the market (**Fig. 2-10** and **Fig. 2-11**).

For the first time, we also include data on heavy-duty vehicles (HDVs) in our EU Pocketbook. The total number of newly registered heavy trucks and buses in the EU was 0.3 million in 2013—more than in previous years, but still nearly 30% lower than before the economic crisis (**Fig. 2-12**). The truck market in the EU is dominated by only five manufacturers, together accounting for nearly 100% of all sales (**Fig. 2-15**).

(2001 = 100%)

**Fig. 2-5**

Passenger cars:
Registrations
by brand

While in reality many brands are part of a larger group (for example VW, Audi, Škoda, Seat and others are part of the Volkswagen Group), for this report it was decided to show each of the brands individually. The reason for this is that brand affiliations have changed in the past (as for example in the case of Daimler and Chrysler) and may change in the future.

Vehicle segment classification used for this report

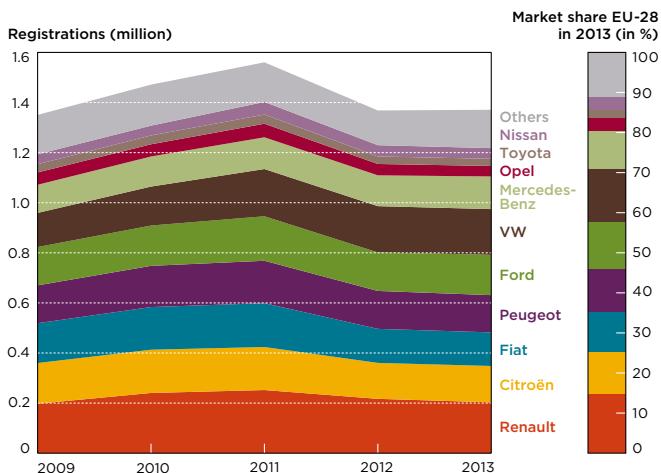

Segment	Example vehicles
Mini	Smart fortwo, Fiat Panda, Citroën C1
Small	VW Polo, Mini Cooper, Fiat Punto
Lower Medium	VW Golf, Audi A3, Volvo C30, Alfa Romeo 147
Medium	BMW 3-series, Mercedes-Benz C-Class, Audi A4, VW Passat
Upper Medium	BMW 5-series, Mercedes-Benz E-Class, Audi A6
Luxury	BMW 7-series, Mercedes-Benz S-Class, Audi A8
Sport	BMW Z4, Porsche 911, Mercedes-Benz SLK, Honda S2000
Van	Mercedes-Benz Viano, Ford S-MAX, VW Sharan
SUV/Off-Road	Mitsubishi L200, Nissan Navara, VW Amarok
Others	VW Transporter-T5, Opel Vivaro, Mercedes-Benz Vito

Fig. 2-7

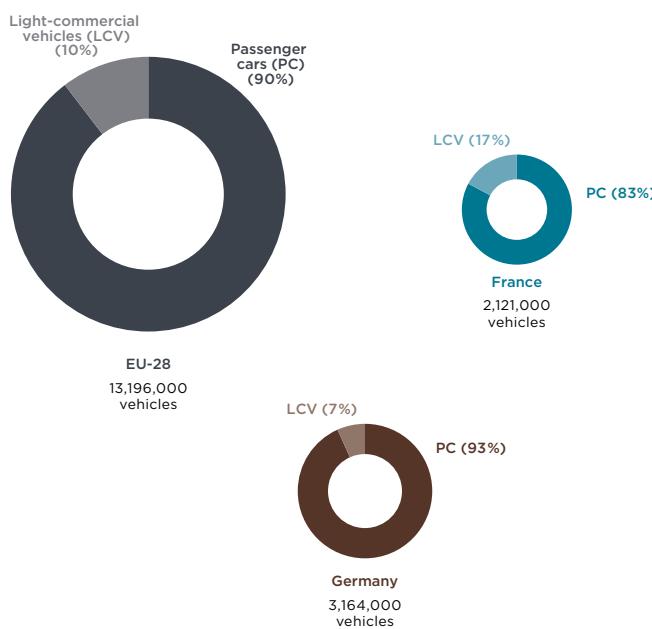

Light-commercial vehicles:
Registrations by Member State

Light-commercial vehicles (N1 category) in the EU are defined as vehicles designed and constructed for the carriage of goods and having a maximum mass not exceeding 3.5 metric tons. They can be further classified into three sub-categories: N1 class I vehicles with a reference mass (mass in running order plus 25 kg) not exceeding 1305 kg; N1 class II vehicles with a reference mass between 1305 and 1760 kg and N1 class III vehicles with a reference mass above 1760 kg.

3 FUEL CONSUMPTION & CO₂

Top-selling vehicle models worldwide

Data sources: ICCT internal databases, vehicle manufacturers' websites, The-Blueprints.com. Vehicle weight normalized to curb weight.
 CO₂ emissions normalized to NEDC test cycle (assuming 100% petrol fuel for Brazil).
 See <http://goo.gl/tLkuOZ>
 Market data includes passenger cars and light-commercial vehicles/light trucks.

The Toyota Aqua is Japan's best-selling vehicle, equipped with a gasoline hybrid-electric engine and emitting about 61 g CO₂/km in the test cycle. In comparison, the most popular vehicle in the US, the Ford F150, is more than twice as heavy and emits around 255 g CO₂/km.

Average CO₂ emissions of newly registered cars in the EU, normalized to the NEDC test cycle, were 127 g/km in 2013.* Thus, the EU's overall 2015 target of 130 g/km was already met two years ahead of schedule. But emission levels vary widely among Member States, with Germany at the upper end (135 g/km) and France at the lower end (118 g/km) of the spectrum. The Netherlands have the lowest emission level (109 g/km), with a noticeably sharp decline since 2007 (**Fig. 3-6**).

In July 2012, the European Commission came forward with a regulatory proposal to set a 2020 target of 95 g/km for newly registered cars. The regulation was formally adopted in March 2014. It sets individual targets for manufacturers, depending on the average vehicle weight of a manufacturer's fleet, and requires all manufacturers to reduce CO₂ emissions by 27% compared to their individual 2015 targets (**Tab. 3-1**). The regulation will be phased in over one year, so that only in 2021 will all vehicles be taken into account when calculating the fleet averages.

For light commercial vehicles (LCVs), a similar 2020 regulation was adopted. It sets an overall target of 147 g/km—16% lower than the 2017 target of 175 g/km. This 2017 target was already met in 2013, when CO₂ emissions of LCVs in the EU reached a level of 175 g/km.

While average CO₂ emissions have dropped for all engine technologies, the decline in emission levels since 2005 has been particularly steep for gasoline vehicles. This is in part due to shifts in market structure, but also to the fact that the CO₂ efficiency gap between gasoline and diesel engines continues to narrow (129 g/km vs. 127 g/km in 2013). Hybrid-electric vehicles show a lower CO₂ emission level (92 g/km in 2013) (**Fig. 3-9**).

*ICCT data on CO₂ emissions deviates slightly from the official European Commission CO₂ monitoring data compiled by EEA and the European Commission (EEA, 2014). The deviation is typically less than 1% and is due to differences in data collection and definitions. The provisional EU-27 2013 average CO₂ emission according to EEA was 127.0 g/km compared to 126.8 g/km for the ICCT's data.

Even within the same vehicle model family, CO₂ emissions can vary significantly. For the VW Golf, the most efficient model version emits 85 g/km of CO₂ (equivalent to 3.2 l/100 km), compared to 165 g/km (7.1 l/100 km) for the least-efficient version (**Fig. 3-10**).

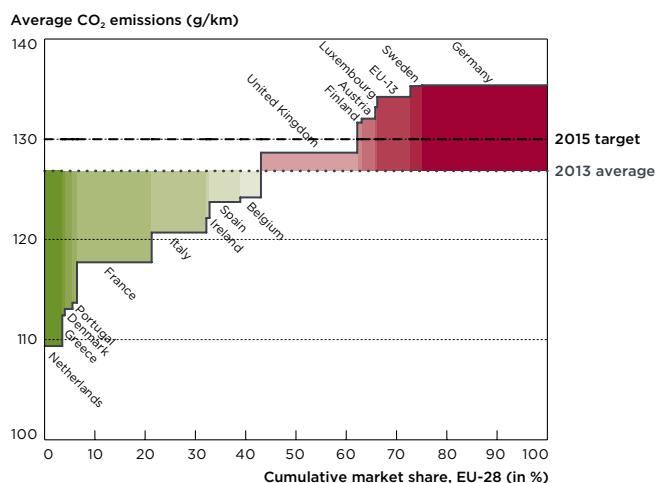

The evolution of key vehicle parameters, such as engine power, displacement, and vehicle weight since 2001, testify to the significant developments in automotive design over the past decade.

CO₂ emissions have decreased significantly, even as average mass has increased. At the same time, manufacturers are extracting more and more power from smaller engines. These developments imply that lower CO₂ emissions would be possible if vehicle weight and engine size were reduced (**Fig. 3-18**).

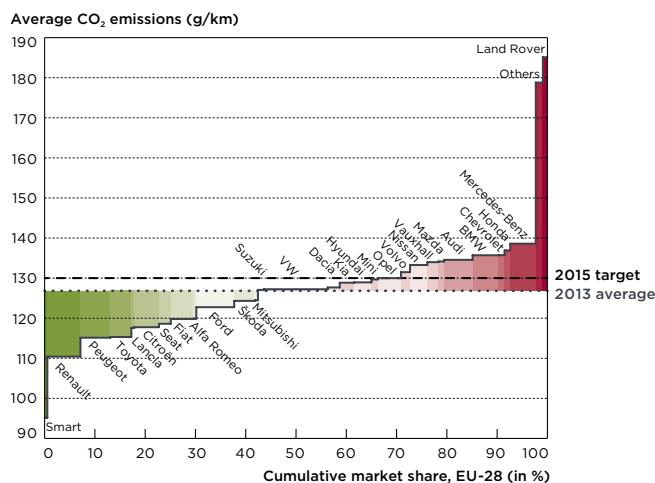

In 2013, for the first time in years, the average weight of new cars in the EU decreased, by about 10 kg (**Fig. 3-16**).

Passenger cars:
Sales-weighted
correlation
 CO_2 emissions
and vehicle mass

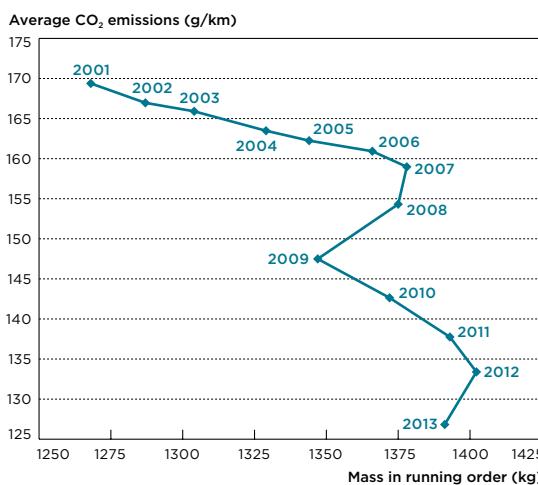

The sales-weighted correlation between CO_2 and vehicle mass is flattening over time, so that a vehicle with the same mass tends to produce less CO_2 in 2013 than in 2001. At the same time the average vehicle mass has increased from 2001 to 2013. If vehicle mass had stayed constant at about 1270 kg the average CO_2 emission in 2013 would likely have been close to 120 g/km instead of 127 g/km, according to the correlation shown in Figure 3-14.

4 TECHNOLOGIES

Hybrid-electric and electric passenger cars New vehicle sales market share

For more detailed information on market shares of electric vehicles as well as fiscal incentives to promote these vehicles in individual markets, see: <http://goo.gl/rc928n>

BEV Battery electric vehicle
PHEV Plug-in hybrid electric vehicle
HEV Hybrid electric vehicle

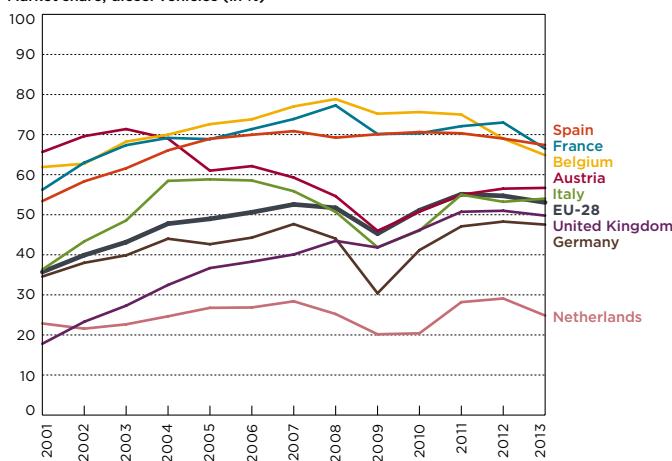

The market share of electrified vehicles varies considerably between the different markets, not least due to large differences in the level of fiscal and other incentives. In Japan, every fifth new car is an electrified vehicle—most of them being hybrid-electric. Norway has seen strong growth rates and has a particularly large share of full battery-electric vehicles. In the Netherlands, due to a tax incentive, many plug-in hybrid cars were put on the road in 2013.

Diesel dominates the passenger car market in the EU; in 2013, 53% of all newly registered cars were powered by diesel engines, slightly less than in the previous two years. As ever, there is significant variation among Member States. Belgium, France, and Spain have diesel take-up rates at around 65%, while in the Netherlands the rate is much lower, 29% (**Fig. 4-1**). Diesel tends to be the preferred fuel for larger segments, while for mini/small and sport vehicles gasoline dominates (**Fig. 4-9**).

The market share of hybrid-electric vehicles keeps increasing, and reached a level of 1.6% of all new car sales in the EU in 2013. This is still relatively low, but more than twice as high as two years ago. In the Netherlands (9.7%) and France (2.7%) hybrid vehicles make up a much larger share than in the rest of EU Member States (**Fig. 4-2**). For Toyota, more than one-fifth of all new vehicles sold in the EU are hybrid-electric (**Fig. 4-6**).

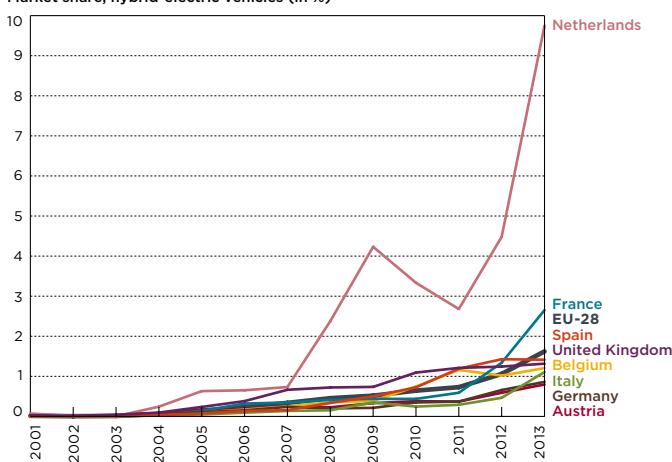

One striking feature of the European vehicle market over the last decade is the sharp increase in market share of passenger cars using gasoline direct injection (GDI) to obtain greater efficiency and lower CO₂ emissions. Overall market share of GDI vehicles increased sharply beginning in 2008, and is estimated at around 30% in 2013. Especially for the premium brands, GDI engines account for the majority of all gasoline vehicle sales in that time-frame. For an accurate comparison of the data, it should be noted that many of the early GDI vehicles limited operation to homogeneous charge only, whereas more complex designs introduced later also allow for stratified charge, with greater efficiency and more CO₂ reduction benefit (**Fig. 4-14**).

5 KEY TECHNICAL PARAMETERS

VW Golf

Top-selling vehicle model in the EU

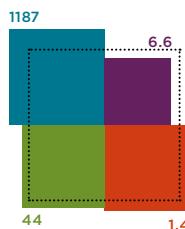

Golf I (1974–1983)

VW Golf II (1983–1992)

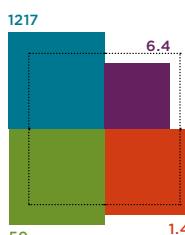

VW Golf III (1993–2001)

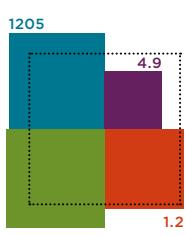

VW Golf IV (1997–2004)

VW Golf V (2004–2008)

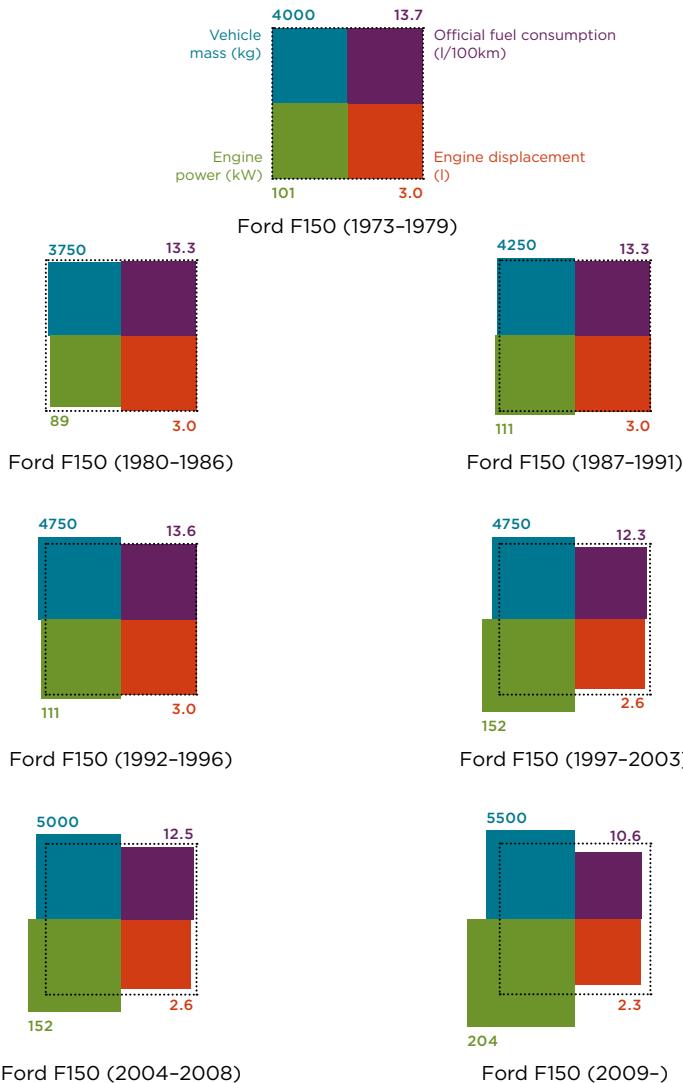

VW Golf VI (2008–2013)

VW Golf VII (2013–)

Ford F150

Top-selling vehicle model in the US

The VW Golf and the Ford F150 are the most popular vehicle models in Europe and the US. Over the years, engine power nearly doubled for both vehicles. At the same time vehicle mass increased by about 40-60 percent. Vehicle efficiency improved considerably, efficiency according to laboratory tests improved.

For the first time in years, the average engine power for new passenger cars in the EU did not increase in 2013, but instead remained constant at 89 kW—still 20% higher than in 2001.

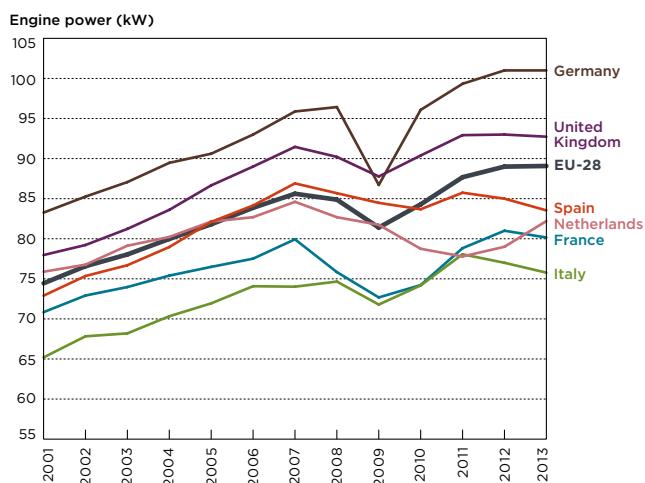

Statistics on vehicle mass and CO₂ emissions show that those countries and brands with bigger, heavier fleets also have the most powerful fleets, and vice versa. Germany's fleet is significantly more powerful than the EU average (101 kW vs. 89 kW), while BMW, Mercedes-Benz, and Audi produce cars even more above the average at 135 kW, 126 kW and 121 kW respectively. At the other end of the scale, the French, Italian, and Dutch fleets all come in around or below 80 kW, while Fiat's average barely exceeds 60 kW. The power figures also display the effects of the economic crisis, with almost all countries' average power dipping significantly between 2008 and 2010 (**Fig. 5-1** and **Fig. 5-2**).

Both engine displacement and average number of cylinders are decreasing, especially since 2007. This is, in part, another effect of the economic crisis, but it also signals an underlying technical trend: improved combustion processes and turbocharging allow manufacturers to extract more power from smaller engines. Thus, manufacturers are able to substitute a 6-cylinder engine for a 4-cylinder, and to generally reduce engine displacement (**Fig. 5-5** to **Fig. 5-12**).

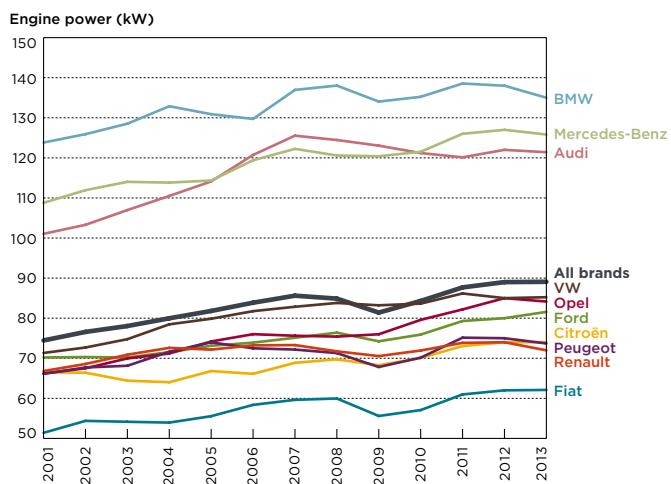

After several years of increases, the average mass of new passenger cars in the EU dropped by about 10 kg in 2013. Sweden (1573 kg in 2013) and Germany (1469 kg) have, on average, the heaviest cars in the EU, Netherlands (1291 kg) the lightest (**Fig. 5-13**). As with vehicle weight, the average size of the new fleet remained constant (**Fig. 5-19**).

Passenger cars:
Vehicle mass
in running order
by Member State

Vehicle mass in running order in the EU is defined as mass of the empty vehicle plus 75 kg of weight for the driver and some luggage, 90% of the fuel capacity and 100% of the capacity of other liquid containing systems (like water or oil). The weight of optional equipment for the vehicle is not included.

brand

Sales taxes in the EU are between 18% and 27%. In addition to the general tax, some Member States have also introduced a special sales or registration tax for new cars. For more details, see the ACEA tax guide (ACEA, 2014). The data in this report were not adjusted for differences in the level of taxation between Member States. Furthermore, the data were not adjusted for inflation.

6 OTHER EMISSIONS & ON-ROAD

Diesel cars: Nitrogen oxide (NO_x) emissions (in g/km)

■ On-road measured value (Carslaw, 2011)/(ICCT, 2014e)
--- Euro emission limit

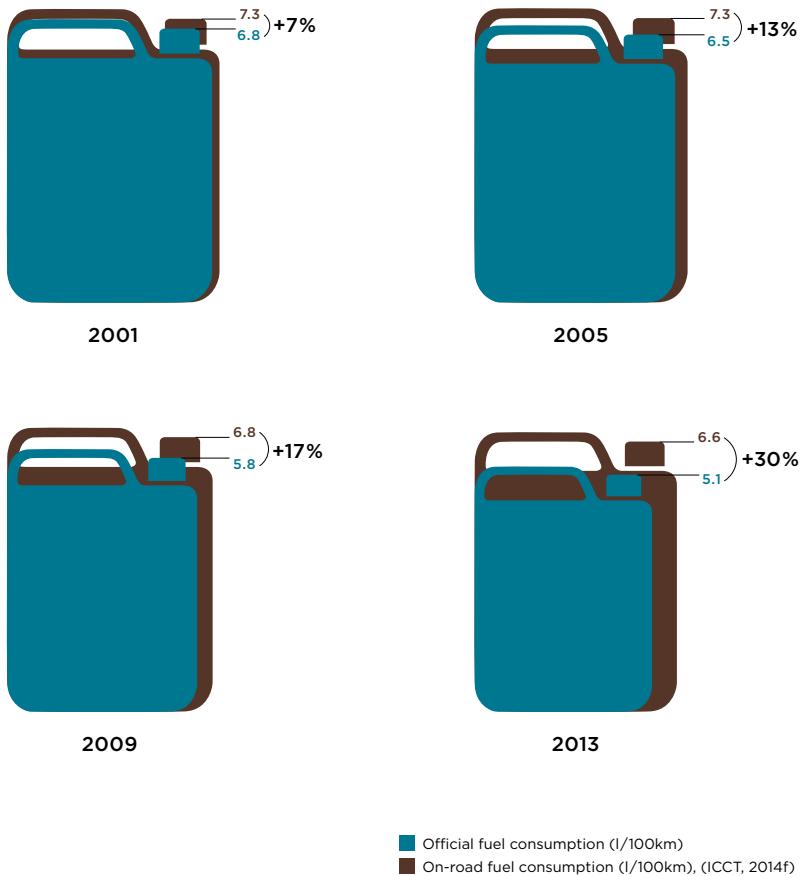

<http://goo.gl/OG9bWn>

<http://goo.gl/xtq2PE>

Diesel and gasoline cars: Fuel consumption (l/100km)

Nitrogen oxide (NO_x) emission limits for new diesel cars dropped from 0.5 g/km in 2000 to 0.08 g/km in 2014. However, on-road testing indicates that for real-world driving conditions, NO_x emissions remained constant or even increased over time. For CO_2 emissions and fuel consumption there is also a growing gap between official and on-road values, both for gasoline and diesel cars.

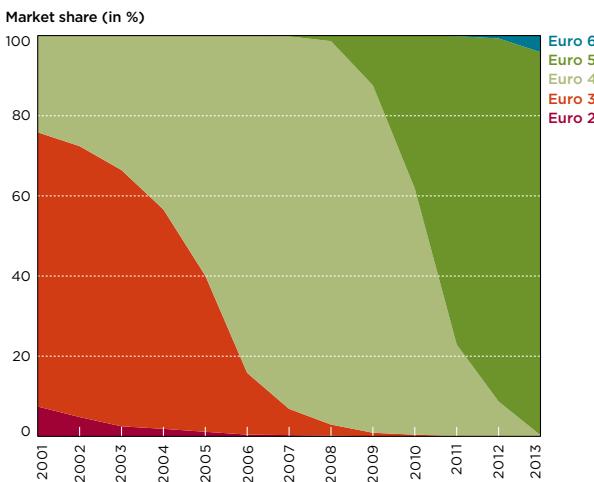

Beginning in September 2014, the Euro 6 emission limit has applied for new vehicle type approvals.

In September 2015 it will become mandatory for all new vehicle sales and registrations. In 2013, about 4% of all new sales were Euro 6 vehicles (**Fig. 6-1**), with remarkable differences among individual brands (**Fig. 6-2**).

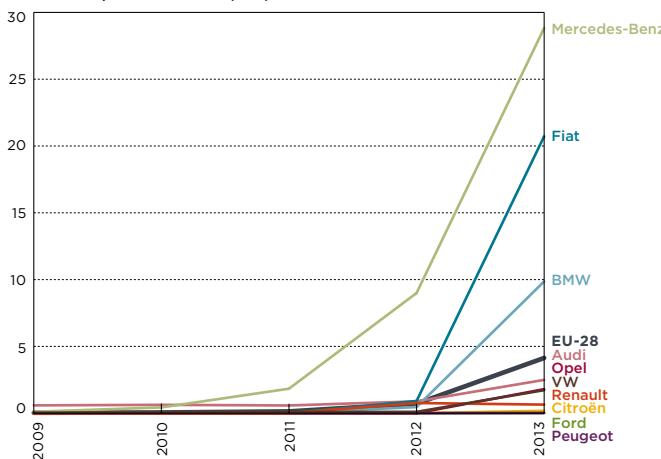

The progression from Euro 3 to Euro 6 resulted in significantly lower emission limits. Emissions, as measured over the NEDC test cycle, are generally in compliance with these limits. However, on-road measured nitrogen oxide (NO_x) emissions have not decreased to the same extent (ICCT, 2014e; Carslaw et al., 2011). For fuel consumption and CO_2 , a similar development can be seen, with a discrepancy between laboratory and on-road fuel consumption of more than 30% in 2013 (ICCT, 2014f).

*For new vehicle types

** 6.0×10^{-1} within first three years from Euro 6 effective dates.

Applies only to diesel and direct-injection gasoline cars.

Emission limits for light-commercial (N1) vehicles class I are identical to passenger car limits listed in Tab. 6-1. N1 class II and N1 class III emission limits are not listed here.

All emission levels as tested in the New European Drive Cycle (NEDC). Emissions levels in real-world driving may differ from the test cycle values. CO: Carbon monoxide; HC: Hydrocarbon; NMHC: Nonmethane hydrocarbon; NO_x: Nitrogen oxide; HC+NO_x: Hydrocarbon and nitrogen oxide; PM: Particulate matter

Remarks on Data Sources

With the adoption of the EU regulation setting CO₂ emission performance standards for new passenger cars (Regulation (EC) No. 443/2009) and light-commercial vehicles (Regulation (EC) No. 510/2011) Member States are required to report certain details for each new vehicle registered in their territory. The information is then compiled and published by the European Environmental Agency (EEA) on behalf of the European Commission. The first statistical report for passenger cars was published in 2011, and the first report for light-commercial vehicles in 2013. Before the adoption of Regulation (EC) No. 443/2009, Decision No. 1753/2000/EC was in place, which established the scheme for monitoring the average specific CO₂ emissions from new passenger cars. Therefore, official EU CO₂ monitoring data for new passenger cars is available from the year 2000 onwards. While these data collections are an important step forward in making transparent and detailed vehicle market statistics for Europe available to the general public, the amount of information included is limited to a few parameters, such as number of registrations, manufacturer, fuel type, CO₂ emission, and vehicle mass.

The basis for the statistics shown in this report is a database compiled by the ICCT. It includes technical information, emission levels, and registration volumes at a car variant level. Sources of information include data obtained by R. L. Polk from various registration authorities, as well as car manufacturers' and importers' associations, data from the European Environmental Agency, the United Kingdom Vehicle Certification Agency (VCA), the German Kraftfahrtbundesamt (KBA), *Automobil Revue*, and information provided directly by manufacturers and suppliers. The Ökopoli-Institute provided assistance to the ICCT in processing raw data, linking various data sources, carrying out quality checks and filling data gaps. Data included in this report are aggregated to a great extent and are only intended to illustrate high-level trends. It is not to be considered official data and does not provide the same level of precision as the EC CO₂ monitoring data.

For light-commercial vehicles only 2009 to 2013 data are available.

For the United States, the Environmental Protection Agency (US EPA) is in charge of releasing a similar annual publication that includes trends on vehicle technologies, CO₂ emissions and fuel economy from 1975 onward (EPA, 2014). For China, a similar statistical overview was prepared by ICCT for the 2010 car fleet (ICCT, 2012).
